

Castle Remembers Jaguar

Tony Topil · creator and project lead

Native Atari Jaguar adaptation of a separate HTML game

Recommended track: Modernize What Matters

Recorded Virtual Jaguar image · Gate 7 V7

The migration challenge

Keep the castle's adaptive idea while rebuilding for 68000 assembly.

Replace browser rendering and input with Jaguar object lists, CRY16 sprites and controller registers.

The HTML and Python/Pygame editions are separate projects. Jaguar is this entry.

Recorded V7 milestone · not a new capture

TOOL ADOPTION

What IBM Bob contributed

Native Windows build path: RMAC 2.5.2, RLN 1.7.7 and Virtual Jaguar Rx R5.

Rendering, input and adaptive-memory foundation, with Gates 1-5 recorded as runtime passes.

Later architecture reviews: text object / buffer (Checkpoint B), resident backgrounds / object order (Checkpoint C).

Existing Gate 1 development-session capture

A traceable collaboration

Oct 4–5 · Bob foundation: toolchain, hero, movement, collision and enemy adaptation.

Oct 5–7 · Claude gameplay: five-floor Gate 7, interactions, expanded memory and test tools. Kimi: visual assets.

Bob B/C approvals supported text and background integration. The broader low-level audit is still open.

The September 29 HTML snapshot is pre-Bob, not pre-hackathon. Its original file remains unchanged.

The native gameplay candidate

Five floors with doors, levers, ladders, enemies, traps and castle observations.

Six-category memory display makes adaptation visible.

Normal-build runtime images exist. Demo candidate: 7aaaa30, not yet merged into main.

Existing V7 climb evidence · original-derived pose

Evidence and limits

Gates 1–5: recorded runtime PASS. Gate 6: assembled, runtime verification pending.

Gate 7 environment-band milestone: 34/34 scenarios; 20,000-frame soak with no invariant violations, per DEVLOG.

Virtual Jaguar images support runtime execution. The Python model is a partial test harness, not full emulation or hardware certification.

No claim of complete HTML parity, physical Jaguar validation, or runtime AI inference.

Demonstration and delivery

2:50 recording: provenance → Bob evidence → native gameplay → adaptation → tests and live access.

The video must show the normal Jaguar build and real Bob work, with clear contributor attribution.

Still required: the YouTube recording and a tested live Jaguar environment URL. An HTML game link is not a substitute.

Recorded V7 floor image · no live URL claimed

Next milestones

Before submission: resolve live Jaguar access, finish the Bob audit, pin the demo build and capture fresh evidence.

Then: hardware validation, deeper behavioral parity and reproducible dependency versions.

Learning: explicit object and memory reviews make a legacy-console port testable; source preservation makes attribution defensible.

Submit by October 18, 11:59 PM Eastern. Target October 17 for final delivery.
